trait is controlled by one gene that has two alleles. Variation in this gene leads to only 2 possible phenotypes. ! In real populations, phenotypic ratios are determined by

only two alleles. In mice, Black fur color (BB or Bb) is dominant to brown fur color (bb). In a population of 100 mice, 36 mice are homozygous dominant (BB), 48 mice are heterozygous (Bb) and 16 are brown (bb). Relative frequency of B = $\frac{\# \text{ of B alleles in the population}}{\# \text{ of TOTAL alleles in the population}}$

Genes and Variation Darwin's original ideas can now be understood in genetic terms. Beginning with variation, we now know that traits are controlled by genes and that many genes have at least two forms, or alleles. We also know that individuals of all species are heterozygous for many genes.
