$1 v + v = 4$. $6 (1/6)dt = et/6$. Multiply the differential equation by $et/6$ to obtain $1 v et/6 + vet/6 = 4et/6$ or $(vet/6) = 4et/6$. Integrate to get $vet/6 = 24et/6 + c$ so $v(t) = 24 + ce^{-t/6}$. Assuming that the block starts from rest at time zero, then $v(0) = 0 = 24 + c$, so $c = -24$ and $v(t) = 24 - 24e^{-t/6}$.

The aim of this book is to help the readers understand the concepts, techniques, terminologies, and equations appearing in the existing books on engineering mathematics using MATLAB. Using MATLAB for computation would be otherwise time consuming, tedious and error-prone. The readers are recommended to have some basic knowledge of MATLAB.

This book is intended to provide students with an efficient introduction and accessibility to ordinary and partial differential equations, linear algebra, vector analysis, Fourier analysis, and special functions and eigenfunction expansions, for their use as tools of inquiry and analysis in modeling and problem solving. It should also serve as preparation for further reading where this suits individual needs and interests. Although much of this material appears in *Advanced Engineering Mathematics*, 6th edition, *ELEMENTS OF ADVANCED ENGINEERING MATHEMATICS* has been completely rewritten to provide a natural flow of the material in this shorter format. Many types of computations, such as construction of direction fields, or the manipulation Bessel functions and Legendre polynomials in writing eigenfunction expansions, require the use of software packages. A short MAPLE primer is included as Appendix B. This is designed to enable the student to quickly master the use of MAPLE for such computations. Other software packages can also be used.

This tutorial shows how to use Maple both as a calculator with instant access to hundreds of high-level math routines and as a programming language for more demanding tasks. It covers topics such as the basic data types and statements in the Maple language. It explains the differences between numeric computation and symbolic computation and illustrates how both are used in Maple. Extensive "how-to" examples are used throughout the tutorial to show how common types of calculations can be expressed easily in Maple. The manual also uses many graphics examples to illustrate the way in which 2D and 3D graphics can aid in understanding the behavior of functions.

A broad introduction to PDEs with an emphasis on specialized topics and applications occurring in a variety of fields. Featuring a thoroughly revised presentation of topics, *Beginning Partial Differential Equations, Third Edition* provides a challenging, yet accessible, combination of techniques, applications, and introductory theory on the subject of partial differential equations. The new edition offers nonstandard coverage on material including Burger's equation, the telegraph equation, damped wave motion, and the use of characteristics to solve nonhomogeneous problems. The Third Edition is organized around four themes: methods of solution for initial-boundary value problems; applications of partial differential equations; existence and properties of solutions; and the use of software to experiment with graphics and carry out computations. With a primary focus on wave and diffusion processes, *Beginning Partial Differential Equations, Third Edition* also includes: Proofs of theorems incorporated within the topical presentation, such as the existence of a solution for the Dirichlet problem. The incorporation of Maple™ to perform computations and experiments. Unusual applications, such as Poe's pendulum. Advanced topical coverage of special functions, such as Bessel, Legendre polynomials, and spherical harmonics. Fourier and Laplace transform techniques to solve important problems. *Beginning of Partial Differential Equations, Third Edition* is an ideal textbook for upper-undergraduate and first-year graduate-level courses in analysis and applied mathematics, science, and engineering.
