The geology of California is highly complex, with numerous mountain ranges, substantial faulting and tectonic activity, rich natural resources and a history of both ancient and comparatively recent intense geological activity. The state formed as a series of small island arcs, deep ocean sediments and mafic oceanic crust were accreted to the western edge of North America, producing a series of deep basins and high mountain ranges. One of the most important events was the advent of the San Andrea

Geology and geological history of California - Wikipedia

California's geography is largely defined by its central feature—the Central Valley, a huge, fertile valley between the coastal mountain ranges and the Sierra Nevada. The northern part of the Central Valley is called the Sacramento Valley , after its main river, and the southern part is called the San Joaquin Valley / ? s æ n w ? ? k i ? n / , after its main river.

The California Geological Survey's interactive geological map allows users to identify the different rock types and fault lines throughout California. In addition to the web viewer, the GIS data can be downloaded for further use. Click here to use the California geological interactive map Source: California Geological Survey

Interactive map of the geology of California | American ...

The Central Valley, also known as the Great Valley of California, covers about 20,000 square miles and is one of the more notable structural depressions in the world. Occupying a central position in California, it is bounded by the Cascade Range to the north, the Sierra Nevada to the east, the Tehachapi Mountains to the south, and the Coast Ranges and San Francisco Bay to the west.

California's Central Valley | USGS California Water ...

The Valley dates back more than 65 million years ago to the Mesozoic, when subduction was taking place off the coast of California. However, the plate tectonic configuration of western North America changed during the Tertiary , and the ancient trench that once characterized offshore California was transformed into a zone of right-lateral strike-slip motion that we know today as the San Andreas fault.

Intro to Geology of the San Joaquin Valley

Turbidites in the Venado Sandstone (Great Valley Sequence) at Lake Berryessa, California. The Great Valley Sequence of California is a 40,000-foot (12 km)-thick group of related geologic formations that are Late Jurassic through Cretaceous in age (150–65 Ma) on the geologic time scale. These sedimentary rocks were deposited during the late Mesozoic Era in an ancient seaway that corresponds roughly to the outline of the modern Great Valley (Central Valley) of California.

Great Valley Sequence - Wikipedia

The Central Valley is a flat valley that dominates the interior of California. It is 40 to 60 miles (60 to 100 km) wide and stretches approximately 450 miles (720 km) from north-northwest to south-southeast, inland from and parallel to the Pacific Ocean coast.

Central Valley (California) - Wikipedia

Rocks of Mesozoic age crop out extensively through the coast ranges of Central and northern California. In the San Francisco Bay region, rocks assigned to the Franciscan Formation consist of rocks in the Pacific Ocean basin and along the western continental margin. The Franciscan Formation, sometimes referred to as an "assemblage" or "basement" complex consist of rock sequences derived from throughout the Pacific Basin region and carried by plate-tectonic motion as fault-bounded terranes ...
