The electrical energy generated at the power stations is conveyed to the consumers through a network of transmission and distribution systems. In the power system, the electrical energy generated at the power stations is conveyed to major sub-stations. From the major sub-stations, it is conveyed to the bulk power consumers by high voltage distribution system of electrical power whereas it is conveyed to the small consumers by the low voltage distribution system.

### (PDF) CHAPTER 5: Electric Power Distribution

Electrical power distribution is the final stage of an electrical power system, which entails the delivery of electricity to the load. The primary role of this section is to carry the electricity from the transmission lines to the loads in the individual customers to the different strata of society. In the power distribution section of an electrical power system, there are two main subsections: primary distribution and secondary distribution.
