Most modern dynamic models of macroeconomics build on the framework described in Solow's (1956) paper.1 To motivate what is to follow, we start with a brief description of the Solow model. This model was set up to study a closed economy, and we will assume that there is a constant population. 2.1 The model

In probability theory, a Markov model is a stochastic model used to model randomly changing systems. It is assumed that future states depend only on the current state, not on the events that occurred before it (that is, it assumes the Markov property). Generally, this assumption enables reasoning and computation with the model that would otherwise be intractable.
