In this tutorial, we show how to create a new XML file using DOM parser provided by JDK.. We're going to create an XML called students.xml which lists students along with their basic information.. 1- Create XML using Transformer. The following code snippet appends 3 student elements to a root element called students and then transforms the document object to a pretty XML file using transform ...

[How to create XML file in Java - Programmer Gate](#)

In this Java xml parser tutorial, Learn to read xml with DOM parser in Java. DOM parser is intended for working with XML as an object graph (a tree like structure) in memory - so called "Document Object Model (DOM)". In first, the parser traverses the input XML file and creates DOM objects corresponding to the nodes in XML file. These DOM objects are linked together in a tree like structure.

[Java Read XML - Java DOM Parser Example - HowToDoInJava](#)

Using that package, you will create a transformer object to wire a DOMSource to a StreamResult. You will then invoke the transformer's transform() method to write out the DOM as XML data. Reading the XML. The first step is to create a DOM in memory by parsing an XML file. By now, you should be getting comfortable with the process.
