Abstract. The fourth edition of *Econometric Methods* by Jack Johnston and John DiNardo, is a rewrite of the venerable third edition by Johnston that sustained several generations of economists. As stated by the authors themselves, the reason for undertaking this major

File Type PDF

Revision is to provide a comprehensive and accessible account of currently available econometric methodology, and in my opinion they have been successful in achieving their objective.

In this important new Handbook, the editors have gathered together a range of leading contributors to introduce the theory and practice of multilevel modeling.

The Handbook establishes the connections in multilevel modeling, bringing together leading experts from

around the world to provide a roadmap for applied researchers linking theory and practice, as well as a unique arsenal of state-of-the-art tools.

It forges vital connections that cross traditional disciplinary divides and introduces best practice in the field. Part I establishes the

Johnston

framework for estimation and inference, including chapters dedicated to notation, model selection, fixed and random effects, and causal inference. Part II develops variations and extensions, such as nonlinear, semiparametric and latent class models. Part III includes

discussion of missing data and robust methods, assessment of fit and software.

Part IV consists of exemplary modeling and data analyses written by methodologists working in specific disciplines.

Combining practical pieces with overviews of the field, this

Computationally-intensive tools play an increasingly important role in financial decisions. Many financial problems—ranging

from asset allocation to risk management and from option pricing to model calibration can be efficiently handled using modern computational techniques. Numerical Methods and Optimization in Finance presents such computational techniques, with an

emphasis on simulation and optimization, particularly so-called heuristics. This book treats quantitative analysis as an essentially computational discipline in which applications are put into software form and tested empirically. This revised edition
