Multivectors and Clifford Algebra in Electrodynamics

In multilinear algebra, a multivector, sometimes called Clifford number, is an element of the exterior algebra  $\wedge(V)$  of a vector space  $V$ . This algebra is graded, associative and alternating, and consists of linear combinations of simple  $k$ -vectors [2] (also known as decomposable  $k$ -vectors [3] or  $k$ -blades) of the form

The algebraic structure which considers multiplication between vectors is called an algebra. An algebra  $A$  is a vector space over a field  $F$  together with a binary multiplication  $\cdot$  in  $A$  such that for any  $a, b, c \in A$  and  $\lambda \in F$  [10]:  
 $(a+b)c = ac+bc$   $a(b+c) = ab+ac$   $\lambda(ab) = (\lambda a)b = a(\lambda b)$ .

Clifford Algebra with Mathematica - arXiv

The geometric algebra (GA) of a vector space is an algebra over a field, noted for its multiplication operation called the geometric product on a space of elements called multivectors, which contains both the scalars and the vector space. Mathematically, a geometric algebra may be defined as the Clifford algebra of a vector space with a quadratic form. ...

CLICAL is a stand-alone calculator-type computer program for geometric algebras of multivectors, called Clifford algebras. CLICAL evaluates elementary functions with arguments in complex numbers, and their generalizations: quaternions, octonions and multivectors in Clifford algebras. CLICAL works directly on intrinsic geometric objects: lines, planes and volumes, represented by vectors, bivectors and multivectors.

The latter algebra is defined as the Clifford algebra of a bilinear form with a suitably chosen anti-symmetric part. The presence of the antisymmetric part changes the structure of the corresponding Clifford algebra and allows one to ...

Clifford geometric algebra of multivectors. There are many possibilities of introducing Clifford algebras, each of them emphasizing a different point of view. In our case, it is of utmost importance to have the Clifford algebra built over a graded linear space.

Geometric algebra works with objects called multivectors. In PGA3D (projective geometric algebra for 3D graphics) a multivector has 5 parts: 0: A scalar part, which is just a real number. 1: A vector part, consisting of four numbers, which in PGA3D represents a plane or a rotation in that plane, like quaternions.

This text explores how Clifford algebras and spinors have been sparking a collaboration and bridging a gap between Physics and Mathematics. This collaboration has been the consequence of a growing awareness of the importance of algebraic and geometric properties in many physical phenomena, and of the discovery of common ground through various touch points: relating Clifford algebras and the ...

Operator Precedence. Note that the operator order precedence is determined by python and is not necessarily that used by geometric algebra. It is absolutely essential to use parenthesis in multivector expressions containing  $\wedge$ ,  $\lrcorner$ ,  $\langle$ , and/or  $\rangle$ . As an example let A and B be any two multivectors. Then  $A + A*B = A + (A*B)$ , but  $A+A^B = (2*A)^B$  since in python the  $\wedge$  operator has a lower precedence ...

It starts with 3D Euclidean geometry along with discussions as to how the descriptions of geometry could be altered if using a non-orthogonal (oblique) coordinate system. The text focuses on Hamilton's quaternion algebra, Grassmann's outer product algebra, and Clifford algebra that underlies the mathematical structure of geometric algebra.
