Rehabilitation strategies that promote motor learning-related neuroplasticity hold promise for improving functional outcomes poststroke. 3 Aerobic exercise may be a particularly effective means of enhancing the capacity of the motor system for plasticity by upregulation of neurotrophins, such as BDNF. 13, 14, 27 Importantly, aerobic exercise alone does not induce neuroplasticity but rather

Intense synaptic plasticity occurring in dendritic spines establishes an important link between functional and structural neuroplasticity.

Dendritic spines thus shape developmental trajectories, learning and adapting to existing or new conditions. 3 Early in development, dendrites have relatively few spines. Subsequent molecular processes result in the formation of many spines, which then undergo changes in structure and function, sculpting the individual's nervous system connectivity ...
