[Ultrasound-guided thoracic paravertebral block.](#) Thoracic paravertebral block produces ipsilateral somatic and sympathetic nerve blockade in multiple contiguous thoracic dermatomes above and below the site of injection, which is effective in treating acute and chronic pain of unilateral origin from the chest or abdomen.

[With the use of ultrasonography in peripheral nerve blocks, paravertebral block can now be performed by direct observation through ultrasound.](#) Ultrasound-guided paravertebral block practices have been reported in children (1, 2). We aimed to share our first experience in ultrasound-guided paravertebral block application.

[Two meta-analyses of randomized controlled trials demonstrated that thoracic paravertebral block \(TPVB\) combined with GA or monitored anesthesia care has several advantages, such as better postoperative pain control, lower incidence of PONV, shorter recovery time, and higher patient satisfaction, compared to GA alone in breast surgery.](#)[6,7 Few studies have been published describing surgery without GA for breast cancer but all included the use of intra-operative opioids for sedation.](#)[8,9](#)

[Anatomy:](#) • Ultrasound has some benefit when performing thoracic paravertebral block close to the midline. • The transverse spinous process and rib can often be visualized, and measuring their approximate depth from the skin can be helpful. This is particularly true in obese patients where the posterior spinous process may be difficult to palpate.
