Tropospheric scatter is a method of communicating with microwave radio signals over considerable distances - often up to 300 kilometres, and further depending on terrain and climate factors. This method of propagation uses the tropospheric scatter phenomenon, where radio waves at UHF and SHF frequencies are randomly scattered as they pass through the upper layers of the troposphere. Radio signals are transmitted in a narrow beam aimed just above the horizon in the direction of the receiver ...

These ionized particles reflect the sky waves back to the Earth. A powerful sky wave may be reflected several times between the Earth and the ionosphere. Sky waves are used by amateur ham radio operators and for military communication. Radio Wave Propagation. In Radio communication systems, we use wireless electromagnetic waves as the channel. The antennas of different specifications can be used for these purposes.
